5. Testing TaxJar Sync Job

- 5.1. Overview
- 5.2. Process

1. Setup

1.1. Overview

This guide is built under the assumption that the TaxJar integration has been installed according to the installation guide included in the integration.

In order to accurately calculate sales tax for an order, TaxJar requires both information from the order itself as well as information from the business. The following sections contain the test business information that was used in the TaxJar app. To exactly duplicate the results of this test guide, that information will need to be used. Actual information from the business can be used as well, but since the locations configured for the account profile and nexus states will be different, tax rates corresponding to those locations will be returned by the TaxJar integration and may not match the ones given in this guide.

1.2. Create TaxJar Account

TaxJar provides free trial accounts for testing our integration and services. If an account already exists simply sign into the [TaxJar app](#). Otherwise an account can be created on the [sign up page](#).

1.3. Configure Business Profile

The business profile is the primary location for your business. To configure it navigate to the [business profile page](#) within the TaxJar app. For the testing purposes in this document, the following information will be used:

Business Address 1: 299 S Main St

City: Salt Lake City

State: Utah

Zip Code: 84111

None of the other fields on this page are required for testing. Simply enter the information above as shown in the screenshot and then use the “Save Information” button to apply the changes.

First Name

Last Name

Business Name

Federal Tax ID

Business Address 1

Business Address 2

City

Country

State

Zip Code

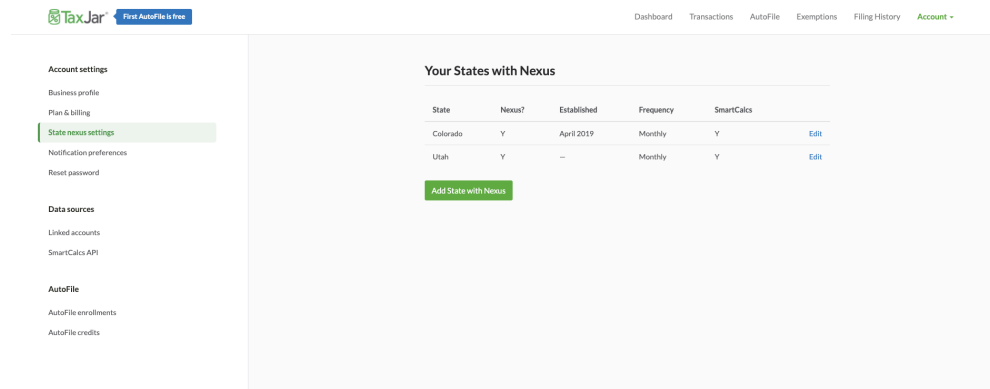

Phone Number

[Save Information](#)

1.4. Configure Nexus States

Nexus is what determines if a business has a responsibility to collect and file sales tax in a state. To set up nexus states in TaxJar navigate to Account > [State nexus settings](#).

Click the “Add State with Nexus” button

Then use the following information to configure the nexus state:

State: Utah

State Assigned Payment Schedule: Annual - calendar year, starts in January

Calculate Sales Tax in This State: Checked

The remainder of the fields are not required for this testing guide. When inputted correctly it will look like the following screenshot:

Add State

State Required

Utah

State Assigned Payment Schedule Required

Select the frequency with which you remit to Utah.

☒ Annual - calendar year, starts in January

☐ Quarterly - remit every quarter

☐ Monthly - remit every month

State Registered Business Name

State Tax ID

Nexus Established

The date you established nexus in the state.

Calculate Sales Tax in This State

☒ SmartCalcs API calls will return sales tax amounts to collect for this state

Save Information

Finally save the information to finish configuring the nexus state.

2. Testing Real Time Tax Calculations

2.1. Overview

The steps for testing this are the same on both Site Genesis and SFRA sites.

2.2. Process

1. Add a product to the cart
2. Navigate to checkout
3. Checkout as a guest and input the following information for the shipping address:

First Name: Test

Last Name: Test

Address 1: 123 S. Main St.

Country: United States

State: Utah

City: Salt Lake City

ZIP Code: 84111

Phone Number: 1111111111

4. After entering the above information SFCC will cause tax to be calculated. The TaxJar integration hooks into this process to get accurate rates based on the basket information. The correct amount of tax will now be displayed in the order summary section of the checkout page.

Note: Due to the way SFCC sends information from the checkout page back to the server for calculations, on Site Genesis you have to continue to the billing screen in order for tax calculation to be performed. For SFRA this normally happens as information is entered into the form, however occasionally you must continue to

payment in order for tax to be calculated. These are not limitations of the TaxJar integration, but rather Site Genesis and SFRA respectively.

5. You can now verify the tax rate is correct by dividing the Sales Tax by the subtotal (Utah is a state that does not tax shipping). For the address given above the tax rate should be .075.

Note: Because SFCC is rounding to two decimal places, the tax rate will not exactly match .075, however it should be close enough to indicate that that is the rate that was returned. In the example in the screenshot below the rate came out to .077. Also, tax rates change over time. To verify that .075 is still the correct tax rate for the address given above please utilize the [TaxJar Sales Tax Calculator](#).

\$119.00	1	\$119.00

3. Testing Customer Exemptions

3.1. Process

The testing steps are the same for both Site Genesis and SFRA. In order to test the customer exemption functionality of the TaxJar integration, an exempt customer must first be created. Use the following steps to setup an exempt customer in SFCC:

1. In Business Manager, navigate to the customer that you would like to exempt.
2. After selecting the customer, under the General tab, scroll down to the TaxJar Tax Exemptions section.
3. Select an exemption type of wholesale and an Exempt State of Utah, and apply the changes.

The screenshot shows the 'TaxJar Tax Exemptions' form. It has two main sections: 'Exemption Type' and 'Exempt States'. The 'Exemption Type' is a dropdown menu currently set to 'wholesale (Wholesale)'. The 'Exempt States' is a list box showing a scrollable list of states: SC (South Carolina), SD (South Dakota), TN (Tennessee), TX (Texas), and UT (Utah). The 'UT (Utah)' option is currently selected and highlighted.

4. Navigate to the storefront and login as the exempt customer
5. Add a product to the cart (preferably the same product as when testing the real time tax calculation) and proceed to checkout
6. Enter the same address as given in section 2.2
7. Proceed to billing (payment on SFRA), verify that the sales tax is \$0.

4. Testing Product Tax Classes

4.1. Setup

4.1.1 Configure Nexus State for New York

The testing steps are the same for both Site Genesis and SFRA. In many states, products of certain categories are taxed with different rates. New York is one of these states. In order for tax to be calculated for an order shipped to New York, New York must be added as a nexus state in the TaxJar app.

Follow the instructions in Section 1.4 but this time using the following information:

State: New York

State Assigned Payment Schedule: Annual - March 1 through February 28

Calculate Sales Tax in This State: Checked

4.1.2 Configure Clothing Tax Class

Follow these instructions to configure a tax class for testing in SFCC:

1. In Business Manager select correct site
2. Navigate to Merchant Tools > Ordering > Taxation
3. Select the Tax Classes tab
4. Click the "New" button
5. In the ID field enter: 19000
6. In the name field enter: Test Exemption
7. Click "Apply"

Navigate to a product in business manager and configure it to have the new clothing tax class that was just created. This is done in the standard SFCC way through the business manager.

4.2. Process

1. Follow the steps in section 2.2 to add a product without a tax class configured to the cart.
2. On checkout use the following shipping address:
First Name: Test
Last Name: Test
Address 1: 47 W 13th St
Country: United States
State: New York
City: New York
ZIP Code: 10011
Phone Number: 1111111111
3. Calculate the sales tax rate by dividing the sales tax by the subtotal plus shipping (New York taxes shipping). Record this value.
4. Repeat steps 1 through 3 this time using the product configured to use the “Test Exemption” tax class.
5. Verify that there is no sales tax applied to the order. (In New York the 19000 tax code is fully exempt).

5. Testing TaxJar Sync Job

5.1. Overview

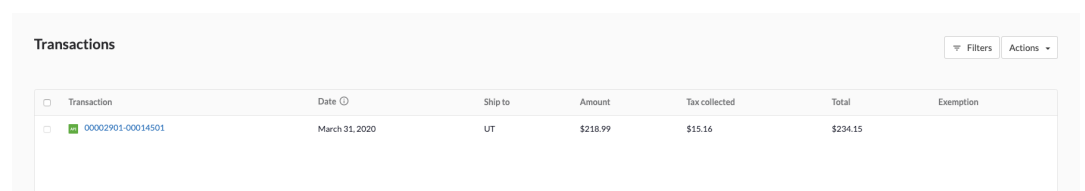

Before testing this feature of the TaxJar integration, it is important to know its limitations. These are listed in section 1.3 of the integration guide. In most scenarios businesses will want to sync order data to TaxJar from their ERP or OMS, rather than directly from SFCC using the TaxJar Sync Job.

In summary, this custom job takes the data from qualifying orders, and sends it to TaxJar for sales tax reporting and filing (when enrolled in AutoFile).

The following process can be used on both SFRA and Site Genesis storefronts.

5.2. Process

1. Configure the job according to the instruction in the TaxJar integration guide (Section 5.3.1).
2. Manually run the job once. Because the job is configured to only sync qualifying orders that have been updated after the last sync time, the first job run will not process any orders.
3. Navigate to the storefront and follow the instructions in section 2.2, this time after reaching checkout continue to the end of the process and create an order.
4. In Business Manager, navigate to the order that was just placed. Set the payment status to paid and the order status to completed (this ensures that the order passes the integration's validation and will sync to TaxJar).
5. Manually run the job again. This time there should be one order processed.
6. Navigate to the [transactions page](#) in the TaxJar app.
7. Verify that the order just created is listed on the page. Note that the transaction ID in the TaxJar app is composed of the SFCC order ID with a hyphen and the shipment ID appended to it. (This allows TaxJar to support multi shipment orders).

The screenshot shows the 'Transactions' page in the TaxJar app. It features a table with columns for Transaction, Date, Ship to, Amount, Tax collected, Total, and Exemption. A single transaction is listed with a green status icon, the ID '00002901-00014501', a date of 'March 31, 2020', a ship to location of 'UT', an amount of '\$218.99', tax collected of '\$15.16', and a total of '\$234.15'. Above the table are buttons for 'Filters' and 'Actions'.

Transaction	Date	Ship to	Amount	Tax collected	Total	Exemption
 00002901-00014501	March 31, 2020	UT	\$218.99	\$15.16	\$234.15	

8. Click on the transaction ID in the TaxJar app to view additional data regarding the transaction.
9. Verify that the data matches between SFCC and TaxJar for the order.
