

Global-e SFCC Production Readiness Assessment

The checklist of actions which have to be done on deploy/rollout Global-e integration from SFCC Staging to SFCC Production

- ☐ Check the Global-e metadata on Staging, if something is not there yet (or you are not sure) – *please import metadata from link_globale /metadata folder*
- ☐ Check Global-e Shipping Methods on Staging, there should be 7 (GLOBALE, GLOBALE_STANDARD, GLOBALE_EXPRESS, GLOBALE_STORE_COLLECTION, GLOBALE_HUB, GLOBALE_DIRECT, GLOBALE_WYOL).
If it's not there yet – *please import metadata from link_globale/metadata folder*
- ☐ Check Global-e Payment Method and Payment Processor on Staging – GLOBALE, if it's not there – please import metadata from link_globale /metadata folder or create it manually (Payment Processor).
- ☐ Check the Tax Class for Global-e Shipping Methods on Staging (after fresh import it might be reset to undefined), it should not be "undefined".
- ☐ Check the configuration of Global-e custom Site Preferences on Staging, add values for Production (on Staging, for Production context, so it will be replicated properly)
- ☐ Check the time configuration of 'Auto-Fail Orders'(path: Merchant Tools > Site Preferences > Order). By default recommended time's amount is 4320(minutes). If the site preference Place Order On Payment Update(gePlaceOrderOnPaymentUpdate) set to 'Yes' then recommended time's amount is 20160(minutes).
- ☐ Check all price books on Staging, including Fixed price books if there any configured in Global-e custom Site Preferences
- ☐ Check Global-e Services, Job Schedules on Staging and on Production. If it's not there yet – *please import from link_globale/metadata folder* on Staging and Production directly
- ☐ Check that GLOBALE Service profile is configured so the Rate Limit is disabled (Enable Rate Limit = false)
- ☐ Check the definitions for Global-e Custom Objects on Staging – GLOBALE_*, if it's not there – *please import metadata from link_globale /metadata folder*
- ☐ Check that int_globale and Global-e extension (int_globale_sitegenesis for SiteGenesis Pipeline or Controller based storefront, int_globale_sfra for SFRA based storefront) cartridges are uploaded into the current code version on SFCC Staging, so it will be replicated properly to SFCC Production
- ☐ Check that int_globale and Global-e extension cartridges are in the cartridge path of your Site (Global-e operated Sites) on Staging
- ☐ **IF ALL ABOVE IS VERIFIED AND LOOKS GOOD – PERFORM DATA REPLICATION TO PRODUCTION** (Services, Job Schedules, Metadata, Site Preferences, Custom Object Definitions, Shipping Methods, Payment Method, Customer Groups, etc.).
If there anything which prevents you to make a data replication from Staging to Production – please do all the above manually on Production (if possible)
- ☐ **PERFORM CODE REPLICATION TO PRODUCTION**
- ☐ Check that int_globale and Global-e extension cartridges (int_gloable_sitegenesis for SiteGeesis, int_globale_sfra for SFRA) are in the cartridge path of your Site (operated by Global-e Sites) on Production
- ☐ Check once again manually Global-e custom Site Preferences, Services, Job Schedules (should be assigned to proper Site(s)), Custom Object definitions, Payment and Shipping Methods on Production.
- ☐ Run Global-e Settings Job manually on Production
- ☐ Enable the Global-e Settings Job to run every day at 2:00 am UTC (or whatever is convenient for you) in the Production
- ☐ Check that GLOBALE_* custom objects now have some records and there are no any errors in GLOBALE_ERROR custom error log on Production
- ☐ Enable Global-e in Global-e custom Site Preferences (if it's not so yet) on Production
- ☐ Clear the cache of the Site(s) and BM on Production manually
- ☐ Make some tests on Storefront of your Production. DONE!
