Overview

This document describes how to configure and customize the automated job for creating a product feed file that can be uploaded to Salesforce Marketing Cloud (SFMC).

It also includes instructions for how this job also provides the data that can then be used for doing “Back in Stock” notifications.

Configuration

The primary configuration for this job is done within the parameters of the custom job step.

Additionally, there is related configuration that can be done if the installation includes doing “Back in Stock” notifications via SFMC.

Site Preferences

The “View Out of Stock Items” site preference needs to be enabled in order for the back in stock notifications functionality to work. It could also be enabled to allow for the selecting of out of stock items. The reason to do this would be to see the image change on the PDP. For example, if the “blue” variation is out of stock in a shirt, if this preference is enabled, then the blue shirt could be selected on the PDP and the image will change from the default to the blue shirt (assuming there is an image associated with that blue variation).

This site preference can be found in the Autobhan Configs and/or Integrations a/o Email & Marketing groups.

Enable Out-of-stock items to be selectable (viewOutOfStockItems) With this enabled, Out-of-stock items will be 'selectable'.	Yes With this enabled, Out-of-stock items will be 'selectable'.
Enable Wishlist	

The “View Out of Stock Items” site preference in the Email and Marketing group

This site preference enables the back in stock functionality built into the cartridge. If enabled, then back in stock notifications will be sent from SFMC.

Likely the above “View Out of Stock Items” will also need to be enabled, however, if the above preference was on and customers subscribed, then it was turned off, if this

preference is still enabled, then that value will be sent to SFMC and emails will still be sent.

Back in Stock Enabled

(BackInStockEnabled)

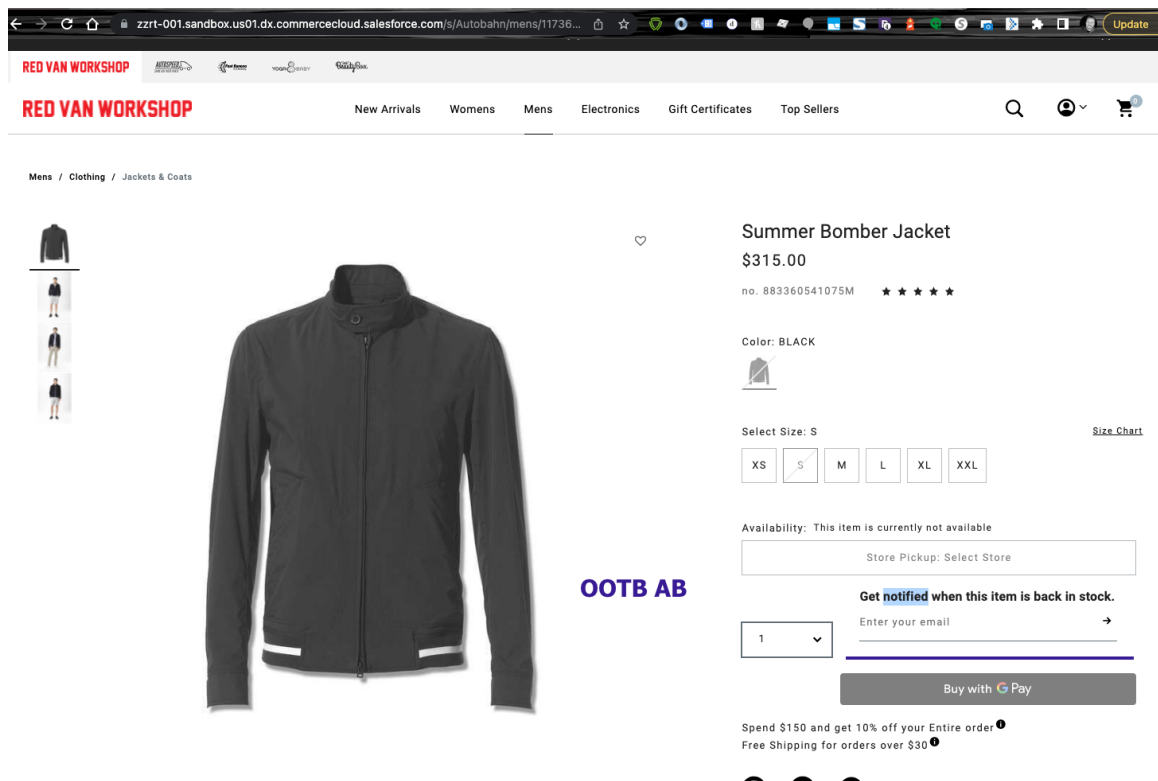

If true, then back in stock notifications are enabled for all products available on the storefront. It will also be likely that the related site preference "viewOutOfStockItems", should be ...

Yes

No

If true, then back in stock notifications are enabled for all products available o...

The "Back in Stock Enabled" site preference in the Email and Marketing group

In out of the box (OOTB) Autobahn (AB), out of stock notifications look like this

Promotion

In order to get a Sales Price for products in the feed that are driven by promotion, any **product** promotions that apply to everyone must have the check box for the “Is Product Promotion for Everyone” custom attribute checked.

Compatibility	
To control this promotion's interaction with other promotions, configure compatibility settings. To control how this promotion generally combines with other promotions, set the Exclusivity. This general exclusivity rule can be overridden by Adding promotions to Exclusivity Groups streamlines the compatibility settings process. You can assign individual promotions or entire groups group IDs. If the value doesn't match an existing promotion or group, there is no change in behavior.	
Exclusivity*:	CLASS (Can't be combined with promotions of the same class.) ▾
Exclusivity Group:	
Combinable Promotions:	
	Add Another Value
Mutually Exclusive Promotions:	
	Add Another Value
Product Feeds	
Is a Product Promotion for Everyone: ☒	To be included in Sales Price calculations for the SFMC Product Feed, a product promotion has to have this checked.

The Product Feeds group on a promotion

NOTE: Only product promotions are considered for use in determining a “Sales Price” for the product as other types of promotions such as Order and Shipping are not relevant without a basket.

The reason for adding this attribute is so that the customer group assigned to a campaign can be whatever makes the most sense to a client, whether it's OOTB groups such as “Everyone”, “Registered” or “Unregistered” or a custom group. The point of the checkbox is identifying that everyone gets this price; it's not a promotion only for a segment of customers.

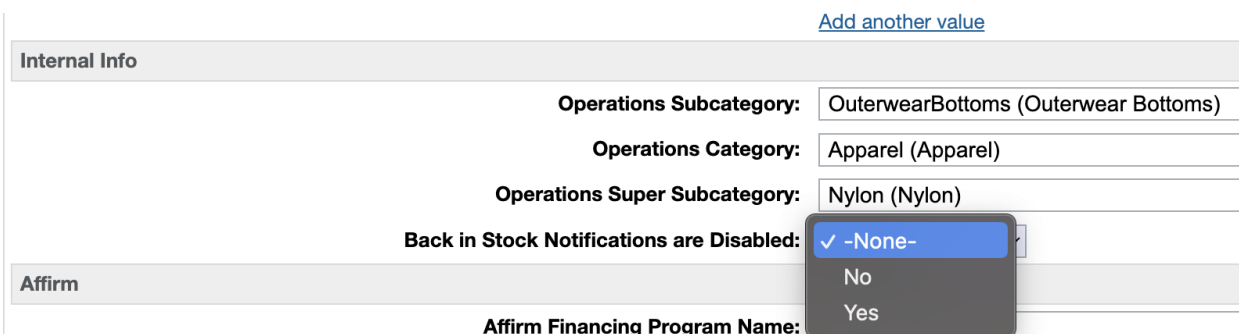

If a client is specifying additional price books as job parameters because they implement sales prices that way, then checking this box on any product promotions may be unnecessary.

System Attributes

The default behavior for “Back in Stock Notifications” is that if it is enabled, then it is for all products, since it is most likely that the desired behavior is that most or all products should support the notification.

However, if some products should not have back in stock notifications, then those individual variants (or masters) can disable the notifications.

Note that if the “view out of stock” site preference is enabled, the out of stock variant(s) will still be selectable on the PDP, but the back in stock notification won’t be shown.

Job Setup

The job step for this product feed can be found under the name “Custom.Salesforce.Marketing.Feed”.

It has the following parameters that can be set:

Parameter	Description	Example / Default Value
Target Relative Path	The relative folder path within the IMPEX system folder	src/export/marketing/product
File Name Prefix	The start of the name of the file feed that will be created	ProductCatalog_
Delimiter	Comma, pipe or tab	Pipe
Include Master Products	If true, master products will be included in the file	False (default)
Log All Products Written	If true, during the write portion of each chunk, the product Id and Name is added to the log file. This is for debugging purposes.	False (default)
Regular Price Book Id	The id of the price book that would have the regular or retail price of the products.	client_msrp_us
Other Price Book Ids	Additional product prices that should be included in the feed file. The column header will be the price book id.	client_sale_us, client_msrp_ca
Custom Product Attribute Ids	Any additional custom attributes on the product that should be included. Boolean, Enum, Number and String are supported. HTML fields should not be sent to SFMC.	Gender,ActualWeight,Type
Product Attribute Host Value Mapping	If the site has multiple host names configured, i.e. a multi-brand site, then using job-hostnames in aliases won't work. The JSON here is used to create image URLs with the vanity address.	See Host Value Mapping for an example

[Job Parameters](#)

Parameters for the SFMC Product job

Host Value Mapping

The Product Attribute Host Value Mapping parameter is needed for sites that have multiple host names, i.e. multi-brand on a single site. In this case, in the alias file there will be a `www.brandA.com`, `www.brandB.com`, etc. and use of the `job-hostnames` configuration is not supported.

In order for the job to be able to support dynamically replacing the address of the instance in the product image URL, the following JSON can be provided to say which product attribute to use, system or custom, and what values in the attribute map to which host names.

```
{
  "Id": "brand",
  "ValueMappings": [
    {
      "Value": "Brand-A",
      "Host": "www.Brand-A.com"
    },
    {
      "Value": "Brand-B",
      "Host": "www.Brand-B.com"
    }
  ]
}
```

Because the job is designed to support as broad a range of attributes as possible, if the Product attribute selected is an object such as an Enum of Strings, the value checked against is the Display Value, not the Value. System or Custom attributes on the Product object can be used.

Job History

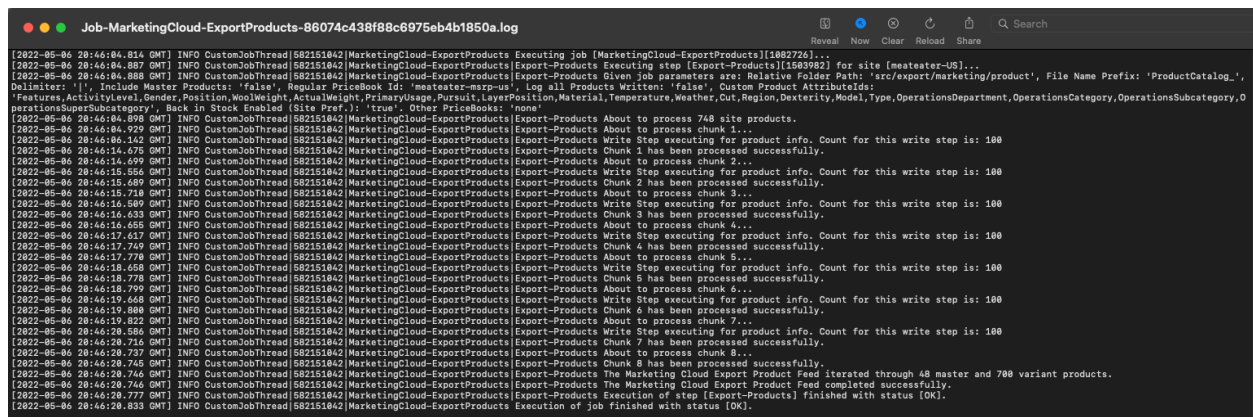

A catalog of around 1,000 products should process in 10 seconds or less on a sandbox. Performance on a primary instance group environment should be better.

The chunk size to process is 100 products at a time. Larger catalogs should still process relatively quickly. Following is an example from a client that at the time had about 750 products.

Job History

Execution of job finished with status [OK].

Feed File

The data that is included in the feed file is composed of a standardized dataset that the Marketing Cloud team has indicated is always useful along with the ability to add in custom product attributes specified in the job parameters.

Standard Data

A standard set of data, taken from product system attributes, category & image assignments, inventory, pricebook and variations, is automatically added to the feed file produced by the job.

That data is described in the following bullet points. The identifier before the bullet point is what is used for the column header in the feed file. After the colon is where the data is sourced. A period then a value indicates a system attribute of the product object; e.g. .ID, .name, .brand, etc. If the data is from another SFCC object then it will be after the product attribute id; e.g. .availabilityModel.inventoryRecord.inStockDate.

- ProductId: .ID
- ProductName: .name
- MasterProductId: .variationModel.master.ID
- RegularPrice: .priceModel.getPriceBookPrice()
- SalePrice: PromotionMgr to get available product promotions
- Online: .online
- OnlineFrom: .onlineFrom
- OnlineTo: .onlineTo
- Brand: .brand
- PageTitle: .pageTitle
- PageDescription: .pageDescription
- IsBundle: .bundle
- IsOrderable: .availabilityModel.orderable
- AvailabilityStatus: .availabilityModel.availabilityStatus
- InventoryQuantity: .availabilityModel.inventoryRecord.ATS
- InventoryInStockDate: .availabilityModel.inventoryRecord.inStockDate
- PrimaryCategory: .primaryCategory (variant or master)
- ClassificationCategory: .classificationCategory (variant or master)
- ProductDescription: .shortDescription
- ProductDetailPageUrl: Product-Show, pid
- ProductImageLarge: .getImage('large')
- ProductImageMedium: .getImage('medium')
- ProductImageSmall: .getImage('short')

- BackInStockEnabled: New "BackInStockEnabled" Site Preference added for this job
- Variations: Iterate over the .variationModel and returns a tilda delimited list of the specific variations for this variant or all the possible variations of a master

Custom Data

See the job parameters sections for detailed information on how to pass which custom attributes to include in the feed file. The supported data types are string, enum of strings, number and boolean. The HTML type is specifically not supported as the SFMC team has indicated it is difficult to handle the encoding and the information would likely not be useful in an email that would be created for product data.

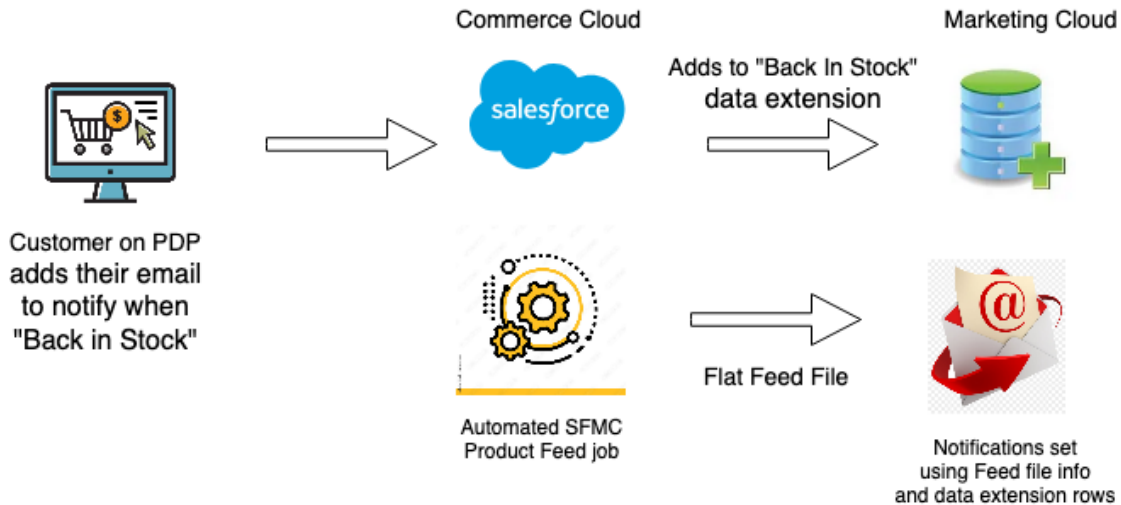

Back in Stock Notifications

Back in Stock Notifications (BISN) are sent from SFMC based on the product data that has been uploaded to SFMC from SFCC in combination with a Data Extension setup in SFMC that SFCC adds customer information to.

The values from the two columns in a new feed file, **InventoryQuantity** and **BackInStockEnabled** are used by SFMC in logic that, if for a specific product, the InventoryQuantity is greater than zero and greater than the minimum threshold for BISN, and BackInStockEnabled is true, then BISN should be sent for the product.

Determining who is sent a notification is done by referencing the associated BISN data extension which links customer email addresses with specific productIds they would like to be notified about.

Note: the minimum threshold for BISN mentioned above is to prevent notifications being sent out for minimal inventory replenishment. For example, if there are ~50 customers signed up for BISN on a specific product, and its quantity just updated from 0 to 1 or 0 to 10, sending notifications is likely to mean people get notified and by the time they follow the link, the product is sold out (again). However, if the quantity has gone from 0 to 25, 50 or 100, then it is more appropriate to send notifications.

Data flows related to Back in Stock Notifications

Example Data

Following is an example of what the header row will look like with all the standard data and three additional custom attributes. In the csv file produced by the job, each of the following lines would be on one line (one return line feed), but they are split respectively over multiple lines in this document to make identifying values easier. Additionally, all of the pipe delimiters (|) have been replaced with a space | space (|) for the same reason.

Header Row

Custom attributes added via job parameter; size

Note: "size" is included as a custom attribute only as an example of how due to the limited options in the default example AB product catalog. It's redundant here because it's included by default with the Variations.

ProductId | ProductName | MasterProductId | RegularPrice | SalesPrice |
 Online | BackInStockEnabled | PrimaryCategory | ClassificationCategory | Brand |
 PageTitle |
 PageDescription |
 InventoryQuantity | InventoryInStockDate | AvailabilityStatus | IsOrderable |
 OnlineFrom | OnlineTo | IsBundle | ProductDescription | ProductDetailPageUrl |
 ProductImageLarge |
 ProductImageMedium |
 ProductImageSmall |
 Variations | size

Values Row

Note: The highlighted portions are the image URLs where instance address was replaced with the host name mapping value.
