Introduction

This document describes the `GlobaleOrderNotifications` job as part of the default/basic functionality of the Global-e SFCC cartridge.

The job sends order update notifications from SFCC to Global-e (in case if such notifications are in the integration scope).

The job contains multiple job steps that handle different types of notifications:

- `UpdateOrderStatus`
- `UpdateOrderDispatch`
- `CreateOrderRefund`
- `UpdateRMA`

UpdateOrderStatus Job Step

When an order is cancelled on the SFCC side it might be required to send the order status update notification from the SFCC to Global-e (depending on the integration scope and the solution).

The job step handles such cases.

How it works:

- once an order is cancelled on the SFCC side it's required to trigger the custom Global-e hook "globale.outboundOrderStatusUpdate", it could be done using the OOTB helper script "cartridge\int_globale\cartridge\scripts\helpers\globaleHooksHelper.js", e.g:

```
1 var globaleHooksHelper = require('*/cartridge/scripts/helpers/globaleHooksHelper');
2 var globaleHelpers = require('*/cartridge/scripts/helpers/globaleHelpers');
3 globaleHooksHelper.invokeCustomHook(
4     globaleHelpers.hooks.jobs.outboundOrderStatusUpdate,
5     'GE10080871180GB',
6     {OrderId: 'GE10080871180GB', OrderStatus: {OrderStatusCode: 'CANCELLED', Name: 'CANCELLED'}, OrderStatusReason: {C
7 });
```

The hook should be triggered with two parameters: SFCC/Global-e order number and notification payload (the payload object and use cases are described in the UOS API document, which is not included in the cartridge documentation and should be requested additionally).

- After the hook invocation Global-e logic creates the notification custom object that is used then by the job step to send the notification to Global-e API (the job should be scheduled to run every 15 minutes).

Required customisation

Only one thing is required here and should be done by Merchant's System Integrator.

- trigger the custom hook "globale.outboundOrderStatusUpdate" with all the required parameters once an order is cancelled on the SFCC side.

UpdateOrderDispatch Job Step

When an order is dispatched to Global-e it might be required to send the order dispatch update notification from the SFCC to Global-e (depending on the integration scope and the solution).

The job step handles such cases.

How it works:

- to send the UpdateOrderDispatch notification the custom Global-e hook "globale.outboundOrderDispatchUpdate" should be triggered, it could be done using the OOTB helper script "cartridge\int_globale\cartridge\scripts\helpers\globaleHooksHelper.js", e.g:

```
1 var globaleHooksHelper = require('*/cartridge/scripts/helpers/globaleHooksHelper');
2 var globaleHelpers = require('*/cartridge/scripts/helpers/globaleHelpers');
3 globaleHooksHelper.invokeCustomHook(
4     globaleHelpers.hooks.jobs.outboundOrderDispatchUpdate,
5     'GE10083988760GB',
6     {OrderId: 'GE10083988760GB', IsCompleted: true, Parcels: [{ParcelCode: 'GE10083988760GB', Products: [{DeliveryQua
7 }];
```

The hook should be triggered with two parameters: SFCC/Global-e order number and notification payload (the payload object and use cases are described in the UODv2 API document, which is not included in the cartridge documentation and should be requested additionally).

- After the hook invocation Global-e logic creates the notification custom object that is used then by the job step to send the notification to Global-e API (the job should be scheduled to run every 15 minutes).

Required customisation

Only one thing is required here and should be done by Merchant's System Integrator.

- trigger the custom hook "globale.outboundOrderDispatchUpdate" with all the required parameters once the order notification should be initiated.

CreateOrderRefund Job Step

When an order refund should be issued it might be required to send the order dispatch update notification from the SFCC to Global-e (depending on the integration scope and the solution).

The job step handles such cases.

How it works:

- to send the UpdateOrderDispatch notification the custom Global-e hook "globale.outboundOrderRefundUpdate" should be triggered, it could be done using the OOTB helper script "cartridges\int_globale\cartridge\scripts\helpers\globaleHooksHelper.js", e.g:

```
1 var globaleHooksHelper = require('*/cartridge/scripts/helpers/globaleHooksHelper');
2 var globaleHelpers = require('*/cartridge/scripts/helpers/globaleHelpers');
3 globaleHooksHelper.invokeCustomHook(
4     globaleHelpers.hooks.jobs.outboundOrderRefundUpdate,
5     'GE10083988760GB',
6     {header: {OrderId: 'GE10083988760GB'}, body: [{CartItemId: 1, RefundQuantity: 1}]}
7 );
```

The hook should be triggered with two parameters: SFCC/Global-e order number and notification payload (the payload object and use cases are described in the COR API document, which is not included in the cartridge documentation and should be requested additionally).

Please keep in mind that the payload object should contain "header" and "body" properties.

- After the hook invocation Global-e logic creates the notification custom object that is used then by the job step to send the notification to Global-e API (the job should be scheduled to run every 15 minutes).

Required customisation

Only one thing is required here and should be done by Merchant's System Integrator.

- trigger the custom hook "globale.outboundOrderRefundUpdate" with all the required parameters once the order notification should be initiated.

UpdateRMA Job Step

The job step sends RMA update notifications from the SFCC to Global-e (depending on the integration scope and the solution).

Usecase: provide the internal RMA number to Global-e instead of suing the Global-e one.

The job step handles such cases.

Additional documentation could be found in the document “Global-e SFCC Cartridge Return Merchandise Authorization”.

How it works:

- to send the UpdateRMA notification the custom Global-e hook “globale.outboundOrderRMAUpdate” should be triggered, it could be done using the OOTB helper script “cartridges\int_globale\cartridge\scripts\helpers\globaleHooksHelper.js”, e.g:

```
1 var globaleHooksHelper = require('*/cartridge/scripts/helpers/globaleHooksHelper');
2 var globaleHelpers = require('*/cartridge/scripts/helpers/globaleHelpers');
3 globaleHooksHelper.invokeCustomHook(
4     globaleHelpers.hooks.jobs.outboundOrderRMAUpdate,
5     'GE10084013107GB',
6     {OrderId: 'GE10084013107GB', MerchantOrderId: '00042703', RMANumber: '277145', MerchantRMANumber: 'RMA277145'}
7 );
```

The hook should be triggered with two parameters: SFCC/Global-e order number and notification payload (the payload object and use cases are described in the UpdateRMA API document, which is not included in the cartridge documentation and should be requested additionally).

- After the hook invocation Global-e logic creates the notification custom object that is used then by the job step to send the notification to Global-e API (the job should be scheduled to run every 15 minutes).

Required customisation

Only one thing is required here and should be done by Merchant's System Integrator.

- trigger the custom hook “globale.outboundOrderRMAUpdate” with all the required parameters once the order notification should be initiated.
